

Dear Mr. President-elect Obama,

Please accept this invitation to visit Iron Mountain Mine in Redding, California.

We are an infamous EPA Superfund site.

Due to the recent discoveries of new technologies, Iron Mountain is now the single largest strategic repository of molecular Iron and Arsenic, Gadolinium, Cadmium, Silica, and Magnesium suitable for large scale deployment of solar power and a superconducting power grid and conversion of internal combustion engines to fuel cell and other nano-catalysts.

This is a technology in competition with the status quo infrastructure that requires CO2 emissions.

This is the only technology with viable net recovery of existing CO2 from the atmosphere. The products which might be possible to be built from pure fused nanotubes is only just beginning. The ability to reinforce building materials with pure carbon fiber is assured to be a revolution in building materials.

Obviously the wide scale adoption of such technologies would have a profound impact upon the economy and the markets.

No doubt some portion of the recent instabilities in the financial markets reflects some discounting of these obsolete technologies already.

As it will no doubt take substantial coordination for these resources to best be put to use, please drop in and let us know how we may be of service to our country in this time of urgency.

[Ted & John](#)
